The marginal significance of severe cognitive impairment persisted when this additional variable for residence in a special care unit or facility that only served people with Alzheimer's disease was added into the equation for the number of ED visits among residents with any ED visits, but the latter was no longer significant. Each hospital system should evaluate available resources, current utilization of space, and consider leveraging existing staff both in the ED and throughout the hospital to attain improved geriatric emergency care outcomes.

A striking finding of the study was that few policy or RCFO organizational variables were associated with ED use. Cherubini A. Ok More Information. Trends and characteristics of US emergency department visits, The timing of each visit was defined according to the day of week and time of day cohort studies are critical to study ED use changes within nested subgroups.
