A fuzzy-optimization approach to dynamic dispatch considering uncertainties. Nanda, A. To prevent unnecessary excessive control action, two types of restrictions are proposed for the upper and lower limits of the control signal, as well as for the area control error.

A robust method of tuning the feedback gains of a variable structure load frequency controller. Here the control was [1]. It is shown that the flexible neural-network-based supplementary frequency controllers give better area control error minimization and a proper convergence to the desired trajectory than do the traditional neural networks. It is mainly employed and global search approach.
